

IT Asset Management

LOGINventory is the premium solution for network inventory, license management and IT documentation. As a complete IT Asset Management suite, LOGINventory provides a comprehensive overview of your IT components and, based on its superior hardware and software discovery, enables reliable license management for your Software Asset Management (SAM).

For inventory and evaluation, LOGINventory must only be installed on a single Windows PC or server with Microsoft .NET Framework 4.5. An installation or roll-out of software agents on client PCs in the network is not necessary: LOGINventory works agentless. In addition, the database can be accessed portably or via web interface.

All Benefits at a Glance:

- ✓ Minimal installation and maintenance effort due to agentless mode of operation
- ✓ Quick overview of entire networks, software and hardware inventory including network topology display
- ✓ Create your own queries/evaluations to focus on information that is relevant to you
- ✓ Change logs of hardware and software, e.g. to support your helpdesk
- ✓ Generate reports for IT documentation
- ✓ Manage licenses using our perfectly integrated software inventory for Windows, Linux and MacOS
- ✓ Define complex calculation rules using our formula editor for computing license states on physical and virtual systems
- ✓ Discover over-licensing and under-licensing
- ✓ License optimization for your software stock
- ✓ Generate reports for compliance processes

Test It Free of Charge Now!

Everything from One Source

Network Inventory

- Windows, Mac, Linux, vSphere, Xen, SSH- & SNMP-capable devices (printers, routers, switches ...)
- Inventory of hardware and actually existing software, packages, SWID tags, patches & hotfixes
- Exchange organization incl. iOS, Android, Windows Mobile
- ActiveDirectory integration
- Agentless mode of operation
- Also for Windows devices outside the LAN (e.g. notebooks or servers in a DMZ)
- Highly scalable for networks of all sizes

Software License Management

- License management e.g. for Office, SQL Server, Oracle, Adobe, physical & virtual operating systems, etc. based on inventory data
- Management of published apps, XenApp, App-V
- Current metrics (i.a. per device, per core, per CPU, per user, secondary use rights, per host inherited to VMs)
- Display of upgrades / downgrades / crossgrades
- Usage statistics for discovering unused software

Evaluations

- Unbeatable level of detail with excellent clarity
- Change history both on asset and network level
- Network topology visualization
- Flexible analyses: Pre-configured & custom queries
- Configurable reports
- Optional: anonymization of user data
